                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 7 describes the construction of pVCPE/2 (pVC45DF+T/2).

pVCPE/2 was made by replacing the 105 base pair PpuMI/ECORI
fragment of pVC45DF+T with a 46 base pair DNA fragment encoding an
inframe duplication of recodons 604 to 613 flanked by unique cloning
sites. This construct is used for generating full-length mols. of PE
with the deletion of residue 553 resulting in an activated toxin
domain (AAQ36019) fused to protein segments of choice between PE
codons 604 and 605. One may replace the ompA signal sequence
with the promoter/ribosome binding site as described for pVC-PEMI-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SWSLMWLVPIGHEKPSNIKVFIHELNAGNQLSHMSPIYTIEMGDELLAKLARDATFFVRA 180

Example 8 describes the construction of pVCPE/2-Ma. pVCPE/2-Ma was made by ligating into the XmaI site of pVCPE/2 a 48 base pair DNA fragment encoding amino acids 55 through 67 (AAQ36020). This construct expresses in E.coli full-length PE with MI amino acids 55 through 67 inserted between PE amino acids 604 and 605 (AAQ38394). One may replace the ompA signal sequence with the promoter/ribosome binding site as described for pVC-PEMI-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MHLIPHWIPLVASLGLLAGGSSASAAEEAFDLWNECAKACVLDLKDGVRSSRMSVDPAIA 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plasmid pVCPE/1-MI:15-106 was made by subcloning a PCR-amplified DNA fragment encoding MI amino acids 15 to 106 into the XmaI site of pVCPE/2 (see AAQ41718). The primers used in the amplification reaction had sequences AAQ41722 and AAQ41723. The construct express in E.coli full-length PE with MI amino acids 15-106 inserted between PE amino acid 604 and 605 (see AAQ41724).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant DNA encoding bacterial toxin-antigen conjugates - are useful as vaccines against viral infections, tumours and parasites

Example 9 describes the construction of pVCPE/2-M1:15-106. pVCPE/2-M1:15-106 was made by subcloning a PCR-amplified DNA fragment encoding M1 amino acids 15 through 106 into the Xmal site of pVCPE/2. The sequence of the oligonucleotide primers used to amplify the M1 segment are those shown in AAQ38395-96, respectively. This construct expresses in E.coli full length PE with M1 amino acids 15 through 106 inserted between PE amino acids 604 and 605 (AAQ38397).
                                                                                                                                                                          180

The resulting construct expresses in E. full-length PE with MI amino acids 55-67 inserted between PE amiacid 604 and 605 (see AAQ41721).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A fragment containing the HIV gag gene was obtained from plasmid HIVPBR322 by PCR with primers that added a SacII site adjacent to the ATG codon of gag (to give the sequence AAQ41729), and a SacI immediately after the termination codon at the 3' end (to give the sequence AAQ41730). The PCR fragment was cloned into plasmid pvC45DF+7 (containing Pseudomonas Exotoxin sequence). In the resulting plasmid, pVC-ompA-PEGAG, the binding and translocation domains of PE were fused to the gag gene of HIV-1. The fusion contains an own leader
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   contains
Bacterial toxin-antigen protein conjugates - to elicit T-lymphocyte immune response, used for preventing viral infections, e.g. by influenza virus, HIV and human papilloma:virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 26 describes the construction of pvC-ompA-PEGAG.

The HIV GAG gene was obtained from plasmid HIVpBR322 by
CC Pick with oligonucleotide primers which added a SacII site
CC adjacent to the ATG codon of GAG to give the sequence of
CC AAQ38412, and a SacI site immediately after the termination
CC codon at the 3' end to give the sequence shown in AAQ38413.

CC rhe PCR fragment was digested with SacII and ligated to the
CC plasmid pvC45DP+T, which had been digested with EcoRI, the 5',
CC overhang filled in by Klenow fragment, and digested with SacII.
CC overhang filled in by Klenow fragment, and digested with SacII.
CC overhang filled in by Klenow fragment, and digested with SacII.
CC construction fuses the binding and translocation domains of PE
CC construction fuses the binding and translocation domains of PE
CC compA leader sequence. Alternatively, any vector contg. the complete
CC coding region for HIV GAG can be used with these oligomers to generate
CC the HIV GAG gene by HIV.
                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                        Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                   В

A control plasmid was constructed which encodes a T7 polymerase driven gene fusion consisting of PE amino acids 2 to 414 followed termination codons. pVC-PEMI-2 was digested with SacII and EcoRI remove the MI sequence. The vector was gel purified and ligated tan oligonucleotide that builds back PE codon no. 414 followed by termination signals shown in AAQ37893. The resulting construction was named pVC-PEBT (AAQ37108).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacterial toxin-antigen protein conjugates - to elicit cytotoxic T-lymphocyte immune response, used for preventing viral infections, e.g. by influenza virus, HIV and human

The PE-derived portion of the hybrid protein allows internalisation of the protein by an antigen-presenting cell. The hybrid protein is then processed and an antigenic segment (i.e. the Influenza A virus matrix protein) is presented on the cell surface where it elicits an immune response.

The PEMa insert (AAQ37890) was prepd. by restricting CC BS-PEMa-1 with SacI and removing the 3' overhang by treatment with CC T4 DNA polymerase, then restricting with ApaI and gel purifying. CC pVC45DF+T was restricted with EcoRI and the 5' overhang filled in CC with Klenow enzyme treatment. It was subsequently restricted with CC ApaI and gel purified. The vector and fragment were ligated together, CC and the resulting construction was named pVC-ompA-PEMa-1. CC The ompA signal sequence was removed from pVC-ompA-PEMa-1 by CC digestion with XbaI and HindIII. An oligonucleotide fragment contg. CC the T7 promoter, ribosome binding site, initiation sequence and a CC build-back of the 5' end of the PE coding region (AAQ37891) was CC pVC-PEMa-1 and encodes a T7 polymerase-driven gene fusion consisting CC of PE amino acids 2 through 414 joined to influenza Ml amino acids CC T to 68 (Ma) (AAQ37892).

The toxins are cross-linked through the free SH group of their unpaired cysteine residues to binding mols. (including monoclonal antibodles, fragments and other ligands) to form immunotoxins, and these immunotoxins do not bind to the cell surface receptors which are bound by the native cytotoxin. However, when the cross-linker is cleaved and the binding mol. is released, the cytotoxin regains
                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                         The new mutated toxin has an unpaired cysteine residue in or near the cytotoxin's receptor-binding slite, and retains the same receptor-binding ability and cytotoxicity as the native cytotoxins provided they are not conjugated with a binding mol. The toxins are cross-linked through the free SH group of their unpaired cysteine residues to binding mols. (Including monoclonal antibodies, fragments and other ligands) to form immunotoxins, and these immunotoxins and the cell surface receptors which are bound by the native cytotoxin. However, when the cross-linker is cleaved and the binding mol. is released, the cytotoxin regains its receptor-binding ability and its cytotoxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Site-specifically mutated cytotoxin(s) with an unpaired cysteine - such that conjugation of a binding mol. to the Cys blocks receptor binding used as immuno:toxins for highly specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   target site; cytotoxin; unpaired cysteine; monoclonal antibody; ligand; cell surface; steric unpaired cysteine; s.u.c.

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score
